

Where Should a City Plant Its Next Ten Thousand Trees?

Every Indian city plants trees. Almost none can say why it chose that spot. We built an app that reads the air, the canopy and the soil of a place — then designs and costs the planting, down to the last sapling.

WHY IT EXISTS

Ahmedabad loses tree cover every year, and nobody could say where it was going fastest. Most greening tools stop at a colourful heat map. Green Vision carries the answer through to the next question: **which plot, which species, and what will it cost?**

WHAT IT READS

Click anywhere on the map and it draws a 100 km² perimeter, reading only what is inside it — air quality at nine points, canopy from satellite, heat, rainfall, and every building, road and park from an OpenStreetMap index on your own computer. No internet, no API keys, and a map read comes back in under a second instead of twenty-five. Five cities ship with real data — Ahmedabad, Delhi, Mumbai, Bengaluru and Chennai — **632 hexagonal cells**, each with 42 months of history.

WHAT YOU CAN BUILD

In the Studio you draw a plot and place trees ranked against that site's own soil and rainfall, along with paths, water, benches and lighting. The cost builds in rupees as you work — a full bill of quantities, with the tax basis and the

tree guard yours to state rather than the app's to assume.

A twelve-check review then scores the design out of 100 and says what is wrong with it: trees too close together to grow, too little shade over a path, too few benches for the space. And a 3D builder reconstructs the real buildings, roads and water around a site, so a plan can be judged against what is actually there.

A figure you cannot trace is worse than no figure at all.

WHO IT IS FOR

Municipal corporations and ward officers who must justify where a planting budget goes; planners and landscape designers who need a costed drawing rather than a heat map; schools studying their own neighbourhood; and anyone who has wondered why their street has one tree on it.

WHERE IT STANDS

Every number on screen carries a chip saying **Measured**, **Modelled** or **Assumed**. Green Vision has reached the **National round** of the India AI Impact Festival 2026. It runs on Windows, works offline, and is free.

A sample site. Every screenshot on this page is of one real place — AMC Symphony Forest Park, Bodakdev, Ahmedabad — used to show what the app reads and what it can lay out on a plot. The park already exists; the planting shown on it is the app's.

Mapped in 3D. Its own paths, lake and neighbours.

From any angle. All read from your own machine.
